# Eclipse Integration

You can speed up your development using jCores and Eclipse a bit more, if you add the $ symbol to your favorites. Do it like this (in the global preferences, search for **favorites**, add **New Member**, enter **net.jcores.jre.CoreKeeper.$** ).

Now $ should be available as a content assist right away. Type **$** in the Java editor and **then press CTRL-SPACE** to get the import. Afterwards you can continue with the core's arguments, e.g: Type ... $ ... CTRL-SPACE ... ("a", "b", "c"). Doing this will auto-import the CoreKeeper and provide you with code completion when you close the parentheses.
